## PARA LOS USOS DE LA NAVEGACION Y ASTRONOMÍA NÁUTICA.

POR EL CAPITAN DE NAVÍO QUE FUÉ DE LA ARMADA,

**DON JOSÉ DE MENDOZA Y RIOS,**

de la Real Sociedad de Lóndres.

---

EDICION ESTEREOTÍPICA, CORREGIDA Y AUMENTADA,

DISPUESTA POR EL GEFE DE ESCUADRA

**DON JUAN JOSÉ MARTINEZ DE ESPINOSA Y TACON,**

DE LA SOCIEDAD FILOSÓFICA AMERICANA, COMANDANTE GENERAL DE ARTILLERÍA Y DE INFANTERÍA DE MARINA, ETC

***Presentada á S. M. por el Excmo. Sr. Marqués de Molins,***

MINISTRO DE MARINA.

PRIMERA TIRADA.

**MADRID:**

IMPRENTA DE J. MARTIN ALEGRÍA, CALLEJON DE SAN MÁRCOS, NUM. 6.

**1850.**

# PRÓLOGO DEL EDITOR.

En el año de 1800 se publicó en Madrid por cuenta del Gobierno, una coleccion de tablas para los usos de la navegacion, dispuestas por el capitan de navío Don José de Mendoza y Rios, quien ya entonces se habia hecho célebre por sus ingeniosas y útiles investigaciones, dirigidas á facilitar y mejorar la resolucion de varios problemas de la astronomía náutica, y principalmente del que tiene por objeto despejar las distancias lunares de los efectos de la paralaje y refraccion.

De allí á pocos años, en 1805, publicó el mismo Mendoza en Lóndres la edicion primera de sus tablas inglesas, la cual conteniendo ya mejoras respecto de la española, se estendió por Europa con rapidez y con ella la reputacion del autor: por último, en 1809 apareció una segunda edicion, inglesa como la de 1805, con algunas simplificaciones útiles y adiciones.

La idea principal que condujo á Mendoza á sus bellos resultados, fué la de introducir en las fórmulas y despues en los cálculos numéricos el seno y coseno verso, líneas trigonométricas que antes de él se definian por todos, mas no se usaban por nadie; y ademas sus relativas subverso y subcoverso, que con las otras dos le sirvieron para resolver el problema de las distancias, al paso que utilizaba los logaritmos de las mismas líneas, para facilitar la determinacion del horario, azimut y altura de los astros, como asimismo

Digitized by Google

de la latitud por medio de dos alturas, conocido el intervalo; á cuya simplificacion contribuyó tambien el pensamiento de introducir los logaritmos secantes y cosecantes, que evitan la necesidad de tomar complementos aritméticos.

Á las tablas necesarias para el uso de sus métodos, unió Mendoza cuantas pueden serlo para la solucion ordinaria de los demas problemas que de continuo se ofrecen al navegante; de todo ello resultó un conjunto sumamente apreciable, que desde luego se reputó como el *Manual de los marinos*, por personas competentes para su calificacion.

La edicion española aun cuando se le quisiese dar una preferencia que no seria justa, se halla enteramente agotada, y de cualquiera de las dos inglesas no se encuentra un ejemplar ni en España, ni en parte alguna, sino á un precio exorbitante. Á esta causa parece natural atribuir la multitud de métodos que posteriormente han aparecido para efectuar la reduccion de las distancias lunares aparentes á verdaderas, casi todos ellos menos exactos y todos mas complicados que el de Mendoza *.

Nadie hay que dispute á este la segunda de las dos ventajas que acabamos de indicar. En cuanto á la de exactitud el único defecto que puede achacársele, cuando se prescinde del aplanamiento de la tierra, es que supone las refracciones medias de Bradley, despreciando las correcciones dependientes de la actual presion y temperatura de la atmósfera. Pero es fácil ver que debiendo en general evitarse aquellas observaciones en las cuales uno de los dos astros ó ambos, tengan una altura muy pequeña, ó bien usarse con prudente desconfianza las que se hallen en este caso, si las circunstancias no hubiesen permitido hacer otras mejores, ninguna utilidad presta el empeño de obtener una grande exactitud en el cálculo. La razon es que si las alturas son de alguna consideracion, el error que produzca el uso de las refracciones medias será despreciable en la práctica; y si alguna

* La unica escepcion que se conoce es el método que da la correccion de la distancia por medio del uso de cuatro estampas sumamente baratas, ideado y publicado en 1806 por el Sr. D. José Luyando, quien de un modo ingenioso lo dedujo de las tablas inglesas de Mendoza, dadas á luz en el año anterior. No es fácil hallar la causa por qué haya caido en desuso el método de Luyando, del cual puede decirse con verdad, que posee el mismo grado de exactitud que el de Mendoza.

Digitized by Google

de las alturas, ó las dos fuesen muy pequeñas, el resultado será incierto, aun despues de corregida la refraccion, porque lo es en el estado actual de la astronomía la determinacion de este elemento, en las inmediaciones al horizonte, por las mejores tablas.

Los marinos ingleses satirizan, y con mucha razon, por medio de la frase *to split straws* el empeño de obtener una exactitud inútil en los resultados de la astronomía náutica, y los españoles con igual oportunidad llaman *Comineros* á los navegantes en quienes se advierte la misma propension. Hay que añadir respecto á este objeto en particular, la consideracion de que la incertidumbre que aun existe en las distancias lunares anunciadas en las efemérides, la que puede haber en la determinacion de la hora de la nave, en la rectificacion ó sea error de índice del instrumento, en las divisiones de la graduacion de este, en la posicion de sus espejos, vidrios oscuros y anteojo y aun en la actual medicion de la distancia por el mas diestro y ejercitado observador, presentan harto mayor motivo de error en la longitud que el desprecio de las oscilaciones de la refraccion y del aplanamiento de la tierra. De modo que aun en las mejores circunstancias y empleando una escrupulosa exactitud en el cálculo, es cuando menos muy difícil asegurar una longitud por distancias lunares, sino dentro de un minuto de tiempo, ó lo que es igual de quince minutos de ecuador.

Lejos, pues, de presentar al piloto en los métodos de cálculo una exactitud minuciosa, que aun obtenida con trabajo y á costa de tiempo es inútil, lo que se le debe proporcionar es facilidad para que con frecuencia deduzca resultados de una aproximacion razonable. El primero de estos dos procedimientos propende á infundirle aversion, ó cuando menos indiferencia á las observaciones, es decir, al único medio seguro que existe hasta ahora de averiguar la verdadera posicion de la nave, cuando desde ella no se ve durante muchos dias sino cielo y agua.

Al hacer las reflexiones anteriores no puede dejar de parecer estraño que desde 1809, no se haya emprendido una nueva publicacion de las tablas de que se trata, hasta 1842, en que el Sr. Richard, oficial retirado de la marina real de Francia, la llevó á cabo con adiciones que acreditan su laboriosidad é inteligencia, con las esplicaciones en los dos idiomas francés é inglés,

Digitized by Google

en un volúmen mucho mas reducido que el del original y de un costo sumamente moderado. Á pesar de todo no puede dejar de advertirse que esta nueva publicacion tiene varios inconvenientes, que seria de desear hubiese evitado su celoso redactor. Uno es el de haber alterado la numeracion de las tablas inglesas, lo cual hace bastante embarazoso el cotejo de estas con las correspondientes de la traduccion. Otro el de haber introducido cálculos de los que creo dejar probado ser inútiles y aun perjudiciales para el uso comun y corriente de la generalidad de los pilotos. El último y mas considerable á mi modo de ver, es la suma pequeñez de la numeracion, que hace las tablas para esta clase de trabajos, de difícil uso, en medio de tantas circunstancias de incomodidad como frecuentemente rodean al navegante.

Despues me ocurrió el pensamiento de que seria posible hacer una nueva y buena edicion española, de precio moderado, en que se salvasen los inconvenientes que creo hallar en la francesa. Ademas me pareció y parece oportuno distinguir en la coleccion original las tablas que á lo menos por mucho tiempo, serán de uso constante y frecuente, de aquellas que, ó no son de utilidad para el piloto, ó suponen métodos que ya han envejecido ó envejecerán probablemente, ó que estan ya sustituidos por otros mejores, ó, por último, que son esencialmente variables, como el catálogo de estrellas, y la tabla de longitudes y latitudes.

En la primera clase se hallan comprendidas las que forman la mayor parte del volúmen; tales son las que sirven para corregir alturas y distancias lunares, las de logaritmos proporcionales, las de números naturales, las de líneas trigonométricas, tanto de las antiguas como de las modernas de invencion de Mendoza, y por último las que sustituyen con ventaja al cuadrante de reduccion para trabajar la estima; sin contar con otras de menor estension, pues bastan las ya citadas para probar mi aserto.

Estas reflexiones me sugirieron el proyecto de una edicion estereotípica española, en la cual no hubiese que hacer mas que sustituir algunas pocas tablas del original con otras adaptadas á métodos posteriores á Mendoza, y suprimir del todo algunas; pero conservando siempre en las reimpresas y en las sustituidas la numeracion de las del original. Y deseando por una parte evitar cuanto pudiera tener visos siquiera de interés mio personal en esta

Digitized by Google

publicacion, y pareciéndome por otra decoroso para nuestro Gobierno el encargarse de ella, honrando por este medio la memoria de un célebre español, me decidí á proponer que así se hiciera, despachándose despues la edicion á costo y costas.

La resolucion del Gobierno fué tal como debia esperarse del señor Marqués de Molins, Ministro de Marina, que no solamente aconsejó á S. M. la aprobacion de mi propuesta, sino que poniendo desde luego á mi disposicion cuantos medios y auxilios eran necesarios para realizarla, dispuso tambien que la esplicacion del uso de las tablas y sus problemas y ejemplos, se hiciese no solo en nuestro idioma, sino tambien en francés y en inglés, porque S. M. deseaba que los beneficios que esta publicacion debe proporcionar á los navegantes fuesen estensivos á los de todas las naciones.

Los adelantos que desde principios del siglo ha tenido la astronomía náutica, y la necesidad de facilitar las operaciones de los cálculos mas usuales en la mar, han hecho indispensable la supresion de varias tablas y la sustitucion de otras. La primera que se ha modificado es la XI, que da la correcion á la paralaje horizontal de la luna, por razon del aplanamiento de la tierra. En la sustituida se ha dado mas ensanche al argumento *Paralaje horizontal*, y el aplanamiento adoptado es $\frac{1}{300}$.

Las tablas XII y XIII en que el autor se propuso comprender la correccion á las distancias lunares, dependiente de la figura de la tierra, se han suprimido, porque no habiendo llegado á publicar el método de usarlas han quedado inútiles; ademas de que el rigor de cálculo que tales correcciones suponen, no se aviene al parecer, con el uso de las refracciones medias adoptadas para la reduccion de las distancias.

La XXII, que contiene un catálogo de 60 estrellas, se ha suprimido tambien, atendiendo á que el Almanaque náutico lo da para cada año en igual ó mayor número, ademas de las posiciones aparentes de las 36 estrellas de Maskelyne y $\alpha$ y $\delta$ *Ursæ minoris*.

La XXIII es otra de las modificadas; da la nueva la aceleracion de las fijas en tiempo sidéreo y en tiempo medio, á fin de facilitar la conversion de cada uno de estos tiempos en el otro.

Digitized by Google

**La XXVII, *Ecuacion de alturas correspondientes*, es distinta de la del autor, de mas fácil uso y la que está hoy generalmente adoptada.**

**La XXVIII se ha suprimido, ó por mejor decir, su contenido va envuelto en la tabla XXIII en la forma que ha parecido mas acomodada á su nuevo objeto.**

**Las XXIX y XXX se han suprimido tambien, porque refiriéndose á las dimensiones y figura de la tierra, no parece que son de aplicacion inmediata para los usos de la navegacion.**

**Á la tabla XXXII del autor se ha sustituido otra dividida en dos partes, la primera de las cuales facilita el cálculo de la hora del paso de la luna por el meridiano; y la segunda da la correccion al establecimiento del puerto, dependiente de la hora de dicho paso y del semidiámetro de la luna.**

**La tabla XXXIII, *Posiciones geográficas*, y la XXXIV, *Trabajo de estima por cuartas partes de cuarta*, se han suprimido: la primera porque seria preciso rehacerla dándole una estension considerable, y aun así sujeta siempre á continuas rectificaciones no parece debe formar parte de una obra que es estereotipa: la segunda por considerarse comprendida en la siguiente XXXV, que da los mismos resultados de grado en grado.**

**En la tabla XXXV se han suprimido los argumentos mayores que $12^h$, en consideracion á que los marinos no cuentan los horarios en tiempo astronómico.**

**Las tablas XXXVI, *Partes meridionales*, XXXVII, *Latitudes disminuidas*, y XXXVIII, *Partes proporcionales para intervalos de* $12^h$ *y* $24^h$, se han suprimido tambien por innecesarias.**

**Á la tabla XXXIX, *Segundas diferencias para intervalos de* $12^h$, se ha sustituido otra que tiene por objeto hallar la correccion, dependiente tambien de segundas diferencias, que debe aplicarse á la hora del primer meridiano, obtenida por medio de distancias lunares, sirviendo de argumentos dicha hora y la diferencia de logaritmos proporcionales.**

**Ademas se han agregado tres tablas nuevas: la primera, que tiene el número XL, está dispuesta por el capitan de navío Don Antonio Martinez de Espinosa, consta de dos partes y facilita mucho la determinacion de la longitud por distancias lunares. La XLI, *Paralaje en altura de los plane-***

Digitized by Google

*tas*, y la XLII, *Complemento de la tabla IX*, que hace estensivo su uso al caso de que la distancia observada sea á uno de aquellos.

Las esquisitas precauciones adoptadas para la correccion de las pruebas proporcionan cuanta seguridad se puede tener de que la obra sale correcta. Á ellas se debe el descubrimiento de los numerosos errores de imprenta que tiene la edicion orijinal de 1809, y ha parecido conveniente acompañar la correspondiente fé de erratas, para que los que las usan puedan corregirlas.

Difícilmeute habria podido dar cima á tan prolija empresa sin el anxilio que con el mayor celo, inteligencia y buena voluntad, me han prestado el brigadier de la armada Don José Sanchez Cerquero, antiguo director del Observatorio astronómico, y el capitan de navío Don Saturnino Montojo, que lo es actualmente. El primero, ademas de encargarse de redactar la esplicacion del uso de las tablas, lo ha hecho tambien de los principios en que el autor fundó sus ingeniosas teorías.

Cádiz 1.° de marzo de 1850.

# ERRATAS

***que tiene la segunda edicion de las Tablas de Mendoza hecha en Lóndres en 1809, que se han corregido en la presente.***

Advertencia. Desde la Tabla VII hasta la X es necesario contar las columnas, así como en todas las demas que no van indicadas por sus encabezamientos, de izquierda á derecha, y las líneas principiando por la 0 de la primera columna sin contar los minutos ó grados que estan sobre las primeras cifras. En la Tabla X las lineas deben contarse por los números de la segunda columna, que principian por 0 y concluyen en el 59, igualmente que en todas las que se hallan en el mismo caso.

**Tabla X.** Número I para la suma de alturas aparentes } y el Argumento Auxiliar.
y Número III para la distancia aparente. . . . . }

Núm. II para la suma corregida de alturas.

**Tabla X.** Número I para la suma de alturas aparentes } y el Argumento Auxiliar.
y Número III para la distancia aparente. . . . . }

Num. IV para hallar la distancia corregida.

**Tabla X.** Número I para la suma de alturas aparentes } y el Argumento Auxiliar.
y Número III para la distancia aparente. . . . . }

Núm. II para la suma corregida de alturas.
